COMSC 110 Introduction to Computer Science 

Project 1: First Steps

Description

This initial project is to introduce you to the development environment that you will use to create your Java programs, and to go through the process of submitting a program for grading.

Step 1 - Familiarize yourself with the course Bridges site

Visit the Bridges COMSC 110 and COMSC 110L sites for your courses. This is where you go for class related materials such as powerpoint slides, homework, and assignments. Look around at the various resources and information available. You should plan to revisit that site regularly throughout this semester.

Step 2 - Install the Java Software Development Kit on your personal computer

If you will be working exclusively on university laboratory computers, such as those in SE206, then you may skip this step (The jGrasp development environment is already installed in the labs).

If you have your own personal computer on which you plan to develop your Java programs for this course, you must install the development environment. Follow the instructions on 2 - Setting up a personal computer for COMSC 110 Lab_F25 (available from Bridges under Assignments ->Lab1) to install the Java Development Kit and jGRASP.

Step 3 – Lab 1 Questions and Answers

Follow the instructions in the attached document 3-1: Lab1 Questions and write your answers on the attached document 3-2: Lab 1 Answers. Submit your 3-2: Lab1 Answers document containing your answers back to Bridges once you finish.

Ste[4 – Debugging a program

As you begin to learn programming, it is also important to simultaneously learn how to *debug* or remove errors from your programs so they can run successfully and produce the right output. Follow the instructions in the attached document 4 -Debug a program and submit your program back to Bridges after you finish. Download ***Debugging1.java*** from the Bridges. Correct all the errors and make sure the program has the appropriate documentation and is formatted correctly. Your program print-out should look like:

```
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
This program used to have lots of problems,
but if it prints this, you fixed them all.
Can you see me???? Why???  -- think about why
 *** Hurray! ***
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
```

Save the file into a new java file with name ***Debugging1_fname_lname.java,*** *where fname and lname are your first and last names.* For example, if a student's name was Jane Doe, the file should be named *Debugging1_Jane_Doe.java.*

Use your editor and debugger to fix any compilation errors that occur, as described in class. Once you have compiled without errors, execute your program. Continue to edit, compile, and execute your programs until you are satisfied with it

Step 5 - Write a Java program

Use the jGrasp environment in the lab or the environment you just installed on your own PC to create a new Java program that is similar to the Hello program discussed in class. Start with the *Hello.java* file discussed in class. Rename the file as ***MyInfo_fname_lname.java*** *where fname and lname are your first and last names.* For example, if a student's name was Jane Doe, the file should be named *MyInfo_Jane_Doe.java.*

Your program should print your **name, your major, and your favorite color**. Include any other information you'd like as well. I will be running these programs on my computer to see the output. Make sure the program has the appropriate documentation and is formatted correctly (indentation, etc.). In general, all of the programs you create for this course should be formatted like the template we created in the class. Don't forget to put the documentation at the beginning of your program.

Step 4 - Submit the programs to be graded

Upload the 3-2: *Lab1 Answers, Debugging1_fname_lname.java* and *MyInfo_fname_lname.java* files to Bridges under Assignment - lab1. Access Bridges through *bridges.rwu.edu*. Please do not upload the ".class" or any other file**.** I will be downloading and opening your files in the jGRASP development environment on my laptop, compiling them and running them. Your file must be capable of being compiled and run in this manner for full credit.

You will be creating Java programs and submitting them, as you did this step, throughout this semester. It is imperative that you understand the details of this process. Talk to the instructor if you have any questions.
